• Introduction
• Military Disease Burden
• Causative Agents
• Clinical Presentations
• Diagnosis
• Treatment

"The death list from disease was a fearful one in the Department of the Gulf. Fever and diarrhea, the former disabling and the latter killing, were worse foes than bullets, ten to one." – Civil War Union Major and Surgeon S.C. Gordon
Definitions

• **Diarrhea**: Alteration in normal bowel movements; increase in water content, volume, or frequency of stools.

• **Acute diarrhea**: < 14 days in duration

• **Persistent diarrhea**: ≥ 14 days in duration

• **Chronic diarrhea**: ≥ 30 days in duration
Normal GI Physiology and Regulation

Figure 15-1. Fluid loads along the gastrointestinal tract. Each day, close to 10 L of fluid composed of ingested food and drink and secretions from the salivary glands, esophagus, stomach, pancreas, bile duct, and duodenum pass the ligament of Treitz. The jejunum absorbs approximately 6 L and the ileum 2.5 L, leaving about 1.5 L to pass into the colon each day. The colon absorbs more than 90% of this load, leaving approximately 0.1 L in the feces. Therefore, the overall efficiency of water absorption is 99%. Reduction of this efficiency by as little as 1% may lead to diarrhea.

Figure 15-2. PINES regulatory system in the intestine. The regulatory system of the intestine integrates paracrine, immune, neural, and endocrine systems and produces coordinated changes in mucosal and muscular function that permit adaptive responses to changing conditions. The regulatory system can widen or narrow the paracellular pathway that governs passive transmucosal permeability of electrolytes, accelerate or retard the transepithelial transport of nutrients and electrolytes by affecting membrane channels and pumps, alter motility by relaxing or contracting various muscle layers in the intestine, and increasing or decreasing mucosal blood flow, thereby influencing intestinal metabolism. Diarrhea may be an appropriate response to acute infection. Maladaptive responses may be responsible for chronic diarrhea. (From Sellin JH. Functional anatomy, fluid and electrolyte absorption. In: Feldman M, Schiller LR, editors. Gastroenterology and Hepatology. The Comprehensive Visual Reference, vol 7: Small Intestine. Philadelphia, Pa: Current Medicine; 1997. p 1.11.)
Differential Diagnosis of Diarrhea

Table 15-3 Differential Diagnosis of Diarrhea

**Acute Diarrhea**
- Infection (see Table 15-4)
- Bacteria
- Parasites
- Protozoa
- Viruses
- Food allergies
- Food poisoning
- Medications
- Initial presentation of chronic diarrhea

**Chronic Diarrhea**
- Fatty Diarrhea
- Malabsorption syndromes
  - Mesenteric ischemia
  - Mucosal diseases (e.g., celiac disease, Whipple’s disease)
- Short bowel syndrome
- Small intestinal bacterial overgrowth
- Malabsorption
  - Inadequate luminal bile acid concentration
  - Pancreatic exocrine insufficiency

**Inflammatory Diarrhea**
- Diverticulitis
- Infectious diseases
  - Invasive bacterial infections (e.g., tuberculosis, yersiniosis)
  - Invasive parasitic infections (e.g., amebiasis, strongyloidiasis)
- Pseudomembranous colitis (*Clostridium difficile* infection)
- Ulcerating viral infections (e.g., cytomegalovirus, herpes simplex virus)
- Inflammatory bowel diseases
  - Crohn’s disease
  - Ulcerative colitis
  - Ulcerative jejunoileitis
- Ischemic colitis
- Neoplasia
  - Colon cancer
  - Lymphoma

**Radiation colitis**
- Watery Diarrhea
  - Osmotic diarrhea
  - Carbohydrate malabsorption
  - Osmotic laxatives (e.g., Mg²⁺, PO₄³⁻, SO₄²⁻)
- Secretory diarrhea
  - Bacterial toxins
  - Congenital syndromes (e.g., congenital chloridorrhea)
  - Disordered motility, regulation
    - Diabetic autonomic neuropathy
    - Irritable bowel syndrome
    - Postsympathectomy diarrhea
    - Postsurgical diarrhea
  - Diverticulitis
  - Endocrinopathies
    - Addison’s disease
    - Carcinoid syndrome
    - Gastrinoma
    - Hyperthyroidism
    - Mastocytosis
    - Medullary carcinoma of the thyroid
    - Pheochromocytoma
    - Somatostatinoma
    - VIPoma
- Idiopathic secretory diarrhea
  - Epidemic secretory (Brainerd) diarrhea
  - Sporadic idiopathic secretory diarrhea
  - Ileal bile acid malabsorption
- Inflammatory bowel disease
  - Crohn’s disease
  - Microscopic colitis
    - Collagenous colitis
    - Lymphocytic colitis
    - Ulcerative colitis
  - Laxative abuse (stimulant laxatives)
  - Medications and toxins (see Table 15-5)
  - Neoplasia
    - Colon carcinoma
    - Lymphoma
    - Villous adenoma in rectum
    - Vasculitis

Mandell. PPID. 8th Ed. Ch 15.
### Differential Diagnosis of Diarrhea

NSAIDs, nonsteroidal anti-inflammatory drugs.
Definitions

• **Traveler’s diarrhea:** Diarrhea developing while traveling and within 10 days of returning home.

  • **Classic:** 3 or more unformed stools within 24 hours and one of the following: nausea, vomiting, abdominal pain, cramps, fever, blood in stools

  • **Moderate:** 1 or 2 unformed stools in 24 hours plus one of the above symptoms –or- more than 2 stools in 24 hours without symptoms

  • **Mild:** passage of 1 or 2 unformed stools within 24 hours and no symptoms

• **Infectious diarrhea:** Diarrhea with an infectious etiology
Impact of Diarrheal Diseases in Modern Military Campaigns

- **World War II**: ‘A few months of the year, malaria would cause more man-days lost, but on the calendar-year average, gastrointestinal infections were well ahead.’¹

- **Vietnam War**: Diarrhea/dysentery largest single disease threat, leading to 4 times more hospitalizations than malaria.²

- **OIF**: Acute enteric illness was leading cause of hospital admission among British forces during first 12 months of operations in Iraq.³

Deployment versus Traveler’s Diarrhea

• Q: Are deployed military personnel similar to travelers?

– A: Some ways yes, some ways no.

• YES: Physically relocated. Variation in food and water source. Variation in environmental exposures.

• NO: Stress. Poor sleep hygiene. Food and water not on economy.* Variations in physical activity.

*Exceptions to this rule understood.
Risk Factors for Deployment or Traveler’s Diarrhea

• Geographic location (hygiene standards)

• Number of viable organisms reaching the intestine
  – Eating habits (wash, peel, cook)

• History of gastric surgery

• Abnormal digestive motility

• Gastric ulcer, antihistaminic drugs

• Immunosuppression
  – Malignancy, HIV, medications, etc.

Laughter is the best medicine... except for treating diarrhea.
History and Physical Examination

- **History**
  - **HPI**
    - Duration of illness, number of stools each day, stool description (water, blood, pus, mucus), other symptoms such as F, S, C, N, or V, efforts to treat and response
  - **ROS**
    - Extra-intestinal (rash, headache, neurologic, etc.)
  - **PMHx / PSHx**
    - Immunosuppression, GI anatomy
  - **SHx**
    - Travel history
    - Food and water source for last 9-10 days
    - Sick contacts
    - Tobacco and ETOH
- **Meds**
  - Antibiotics
History and Physical Examination

• Physical Examination
  – Vitals
    • HR, BP, Pulse pressure, Orthostatics, Temperature
  – HEENT
    • Sunken eyes, mucus membranes
  – Skin
    • Rash, turgor, perfusion
  – Cardiac
    • Tachycardia
  – Lungs
    • Respiratory rate, clarity of breath sounds
  – Abdomen
    • Bowel sounds, distention, TTP, rebound, etc.
  – Extremities
    • Perfusion
Clinical Presentations

• Watery diarrhea (80%)
  – ± Abdominal cramps
  – ± Nausea
  – ± Vomiting
  – ± Fecal urgency
  – ± Low-grade fever

• Dysentery (1-5%)
  – Fever
  – Tenesmus
  – Mucoid stools
  – Grossly bloody stools

• Gastroenteritis (≤10%)
  – Recurrent vomiting

* If the illness can be linked to the ingestion of a particular food or meal, as in an outbreak, the incubation period can be deduced and the differential diagnosis narrowed accordingly. If the incubation period is less than 6 hours, *S. aureus* and *B. cereus* are likely causes; if the incubation period is 6 to 24 hours, *C. perfringens* and *B. cereus* are likely causes; and if the incubation period is 16 to 72 hours, possible causes include noroviruses, enterotoxigenic *E. coli*, vibrio, salmonella, shigella, campylobacter, yersinia, Shiga toxin–producing *E. coli*, giardia, cyclospora, and cryptosporidium. NC denotes not characteristic.

† Bloody diarrhea in an afebrile patient is suggestive of Shiga toxin–producing *E. coli* infection, although this is not always the cause.

‡ Leukocytosis is found in approximately 50 percent of patients.

</table>

* Classically, patients with intestinal amebiasis present with heme-positive or bloody stools.

† Although cryptosporidiosis is typically considered to be noninflammatory in the United States, fecal evidence of inflammation is common in children with cryptosporidiosis in developing countries.

¶ Fatigue, which may be profound, is reported in more than 90 percent of patients with cyclosporiasis.

**Vomiting occurs more frequently than diarrhea in children; diarrhea occurs more frequently in adults.

Pathogens: Acute Watery Diarrhea

• Bacteria
  – Enterotoxigenic *Escherichia coli* (ETEC)
  – Enteroaggregative *Escherichia coli* (EAEC)
  – *Vibrio cholerae*

• Viruses

• Parasites

• Food poisoning

---

Pathogens: Acute Bloody Diarrhea

• Bacteria
  – Enterohemorrhagic *E. coli* (EHEC)
  – Enteroinvasive *E. coli* (EIEC)
  – *Shigella* species
  – *Campylobacter* species
  – Nontyphoidal *Salmonella*
  – *Entamoeba histolytica*
Persistent Travelers’ Diarrhea

• Travelers’ diarrhea is often self-limited
  – Majority of cases resolve after several days

• Persistent illness
  – Lasting >1 week: 10% of cases
  – Lasting >1 month: 2% of cases

• Etiological considerations with persistent diarrhea
  – EAEC (occasionally, *Campylobacter*, *Salmonella*)
  – Parasitic diarrhea
    • *Giardia lamblia*
    • *Cryptosporidium parvum*
    • *Cyclospora cayatanensis*
Stressors Amplify Diarrhea Morbidity

Illness severity

- not ill
- mild
- moderate
- severe

% dehydration

- 0: normal physiologic function
- 5: diminished G tolerance, decline in psychomotor performance
- 10: increased heart rate, dizziness
- 15: death

Fluid/Electrolyte Losses

- Insensible water loss

Slide courtesy of CAPT S. Savarino
Post-infectious Irritable Bowel Syndrome

- Approx. 1 in 12 people develop PI-IBS after infectious diarrhea
- Higher risk associated with prolonged illness and invasive pathogens
- Onset usually occurs within 6 months after infection
- Can persists 5-6 years in 60 - 70% of people

Pathogens – Clinical Syndromes
Types of *Escherichia coli* (E. coli)

- *E. coli* consists of a diverse group of bacteria
- Pathogenic *E. coli* strains are categorized into pathotypes
- Six pathotypes are associated with diarrhea

1). Enterotoxigenic *E. coli* (ETEC)
2). Enterohemorrhagic *E. coli* (EHEC)  
[Shiga toxin-prod. *E. coli* (STEC)]
3). Enteroaggregative *E. coli* (EAEC)
4). Enteroinvasive *E. coli* (EIEC)
5). Enteropathogenic *E. coli* (EPEC)
6). Diffusely adherent *E. coli* (DAEC)
Diarrheagenic *Escherichia coli*: Pathogenesis

**ETEC**
- Fimbrial colonization factors mediate enterocyte adherence
- Elaboration of secretory heat-labile (LT), heat-stable (ST) enterotoxins

**EAEC**
- Enterocyte adherence and **biofilm formation**
- Elaboration of secretory enterotoxins and cytotoxins

**EIEC**
- Colonic epithelial cell invasion
- Lysis of phagosome
- Cell-to-cell spread via actin microfilament nucleation

adapted from Kaper JB et al *Nat Rev Microbiol* 2004
Diarrheagenic *Escherichia coli*: Pathogenesis

- **EPEC**
  - Intimate adherence to small bowel enterocytes
  - Attaching and effacing lesion, with cytoskeletal derangement
  - Induction of inflammatory response

- **STEC**
  - Induction of attaching and effacing (AE) lesions in the colonic epithelium
  - Elaboration and absorption of Shiga toxin (STx)

- **DAEC**
  - Signal transduction effects
  - Cellular projections induced that enwrap bacteria

adapted from Kaper JB et al *Nat Rev Microbiol* 2004
Enterotoxigenic *E. coli* (ETEC)

- Watery Diarrhea

- Low-grade fever, nausea, malaise, abdominal cramping, and diarrhea

- Occurs within 1 to 3 days of ingestion
- Resolves within 3 to 4 days.

- Leading cause of travelers’ diarrhea.
- Virulence due to a heat-labile and heat-stable toxin
- Contaminated water or food is responsible for transmission
- High infective dose of the bacteria is necessary
Enterohemorrhagic E coli (EHEC) / Shiga Toxin Producing E. Coli (STEC)

• Watery diarrhea → bloody stools (few days)

• Abdominal pain (RLQ), cramping, fever absent / low-grade.
• As many as 10% develop hemolytic uremic syndrome (HUS). Case fatality rate of 3% to 5%, common cause of renal failure, neurologic sequelae, hemolytic anemia, and thrombocytopenia.

• Incubation period 2-10 days; symptoms up to 2 weeks.

• Adheres to gut epithelium, produces Shiga toxins, (also called verotoxins), similar or identical to the toxin elaborated by Shigella. Best known EHEC serotype is 0157:H7. Antibiotics may pre-dispose to HUS.
Campylobacter jejuni

- Watery to dysenteric diarrhea

- Abdominal pain and cramps, and fever. Nausea, vomiting, headache, and malaise frequently occur.

- Complications may include Guillain-Barre syndrome, hemolytic uremic syndrome, toxic megacolon, cholecystitis, meningitis, and reactive arthritis.

- Incubation period 1-10 days, disease 2-7 days, may be biphasic illness.

- Animal-to-human transmission is common. Improperly cooked chicken is a major source of illness.
Nontyphoidal *Salmonella*

- Watery or dysenteric diarrhea

- Nausea, vomiting, abdominal cramping, fever (50%), RLQ or peri-umbilical pain, 10% with bacteremia, carrier state.
- Reiter syndrome is a long-term sequel, ~2% to 29% of patients, especially among persons with the HLA-B27.

- Incubation 6-48 hours, >1 week reported, persists 4-7 days
- Contaminated foods of both plant and animal origin. Fecal-oral transmission from infected animals or persons. Poultry are prone to colonization by *Salmonella*; disease transmission while handling birds, consuming undercooked poultry, and eating inadequately cooked eggs. Handling of pet reptiles is another well known source of infection.
Salmonella (typhi and paratyphi)

- “Pea soup” diarrhea

- Initially, symptoms are absent, then bacteremia, then high fever, abdominal pain, “rose spots.” Fever becomes more constant with the development of altered mental status.

- Intestinal perforation and hemorrhage may occur. Multi-organ system involvement is frequently present. Untreated typhoid fever carries a mortality rate of 12% to 30%.

- Incubation 1-2 weeks, Illness lasts about 1 month, relapse

- A prolonged, antibiotic-resistant carrier state usually indicates the presence of the disease in the gallbladder and is an indication for cholecystectomy.
Shigella

- Dysenteric stools, blood, mucus

- Lower abdominal pain and small-volume, dysenteric stools. High fever and rectal burning. Illness 1-7 days, may be biphasic, frank hematochezia in the second phase.

- Potential complications include seizures, meningitis, appendicitis, hemolytic-uremic syndrome, reactive arthritis, and postinfection irritable bowel syndrome.

- The incubation period is usually 12 to 96 hours

- Species: S dysenteriae, S flexneri, S boydii, and S sonnei

- Person-to-person contact, food, water, and fly transmission
Vibrio cholerae

- Voluminous “rice water” stools

- “Classic” cholera: vomiting, abdominal distension, rapid intravascular volume loss, fever and bacteremia in minority

- Incubation 6 hours - 5 days

- Multiple pathogenic species of Vibrio exist (ex. O1, O139)
- Contaminated food and water responsible for most illness
- Clinical significance of the organism is due to the virulence of the various toxins elaborated by different strains.
Clostridium difficile

- Watery diarrhea, may contain blood, mucus
- Cramping and tenderness in the lower abdomen, malaise, mild temperature elevation
- Toxic megacolon with fever, abdominal distention / pain
- Risk factors include comorbidities, advanced age, recent (within 3 months) antibiotics, ↑ gastric pH
- All antibiotics may cause, Clindamycin, cephalosporins, fluoroquinolones, penicillins most implicated
- Antibiotic-altered gut flora, colonization by C difficile, inflammatory exotoxins toxin A and toxin B
Yersinia enterocolitica

- Diarrhea, may be frankly bloody

- Abdominal pain and fever, RLQ pain may mimic appendicitis. Symptoms typically persist for 1 to 3 weeks.

- The incubation period for yersiniosis is 1 to 10 days
- Tonsillitis and mesenteric adenitis may be present.
- Postinfection sequelae may include erythema nodosum, erythema multiforme, and reactive polyarthritis.
Rotavirus

• Watery diarrhea

• Begins abruptly with nausea, vomiting, fever and headache.

• Incubation period of 1-4 days. May persist for 4 to 5 days.

• Primary mode of transmission is fecal-oral.
• Most pediatric infections due to Group A rotavirus strains. Groups B and C are also known to be pathogenic.
• Viruses survive on dry fomites for up to 60 days.
• Good hand-washing technique is critical when caring for patients with rotavirus gastroenteritis.
Norovirus

- Watery diarrhea.
- Nausea, vomiting, abdominal cramps. Low-grade fever and myalgias. Dehydration may occur in severe cases.
- Incubation of 24-36 hours. Resolution within 24-48 hours.
- Transmission is thought to be primarily fecal oral. It appears that aerosolization may also lead to infection.
- Numerous outbreaks related to consumption of raw shellfish, particularly oysters, have also been reported.
- Viral shedding may be present for 2 or more weeks.
Entamoeba histolytica

• Mild diarrhea followed by dysentery.

• Low-grade fever, abdominal cramping, and anemia. Severe pancolitis mimicking inflammatory bowel disease. Amebic liver abscess formation is a well-known entity.

• Illness 2 to 4 weeks after exposure.
• Common in tropics where poverty is prevalent. North America, most frequently seen among institutionalized persons, MSM, and immigrants or travelers.
• Contaminated food or water.
Entamoeba histolytica Life Cycle

Ingestion of fecally contaminated water or food containing *Entamoeba histolytica* cysts

- **Self-limiting, asymptomatic infection**
  - 90% of cases

- **Invasive Disease**
  - 10% of cases
  - Extraintestinal disease
    - <1% of cases

- **Pleural and pericardial effusions**
- **Liver abscess**
- **Colitis**
- **Hematogenous dissemination**
- **Mucin layer**
- **Excystation**
- **Invasion of colon by trophozoites**
Giardia lamblia

• Diarrhea with steatorrhea

• Abdominal pain and cramping, flatulence, nausea and vomiting.

• Ill 2 to 4 weeks after ingestion.

• Contaminated food or water, or direct fecal-oral contact.
• Daycare centers, international travelers, and MSM.
• Post-infection irritable bowel symptoms have been reported in significant number of patients.
Giardiasis Life Cycle

Giardiasis
(Giardia intestinalis)

Contamination of water, food, or hands/fomites with infective cysts.

Trophozoites are also passed in stool but they do not survive in the environment.

1 = Infective Stage
2 = Diagnostic Stage
3 = Cyst

1 2 3 4 5

Cyst Trophozoites

UNCLASSIFIED
Cryptosporidium

- Watery diarrhea

- Infection may be asymptomatic but often leads to abdominal cramping, malaise. Systemic manifestations occasionally occur.

- C parvum and C hominis cause disease.
- Particularly problematic among HIV-infected individuals.
- Waterborne illness, may also be traced to contaminated food or person-to-person contact.
- To prevent transmission, persons who have been infected with Cryptosporidium should not swim for at least 2 weeks after cessation of diarrhea.
Cryptosporidiosis
Cyclosporiasis

- Persistent diarrhea.

- Anorexia, nausea/vomiting, abdominal cramps, flatulence, low grade fever, weight loss. Chronic diarrhea in immunosuppressed.

- Contaminated food and water; no person-to-person.

- *C. cayatanensis* found only in humans.
Cyclosporiasis
## Complications of Bacterial Diarrhea

</tbody>
</table>
Diagnosis

• Risk factors
  • Geography, baseline health, exposures

• Clinical picture
  • Inflammatory vs. non-inflammatory diarrhea

• Laboratory
  • Assets may be non-existent
  • Some pathogens evade routine laboratory tests
    • Diarrheagenic *E. coli* (ETEC, EAEC, EIEC)
    • Norovirus
Diagnosis: Stool Culture

• Stool culture: clinical indications
  • Severe diarrhea (≥ 6 loose/liquid stools/24 hrs)
  • Febrile enteritis and/or dysentery
  • Persistent diarrhea (≥ 14 days duration)
  • Bloody diarrhea (at risk for Shigella, STEC)
  • Inflammatory enteritis (by stool diagnostics)

• Stool parasitology: clinical indications
  • Persistent diarrhea (≥ 14 days duration)
  • Diarrhea in traveler from known high risk region
Personal Prevention Measures

• Food
  – Eat
    • Food that is cooked and served hot
    • Hard-cooked eggs
    • Fruits and vegetables you have washed in clean water or peeled yourself
    • Pasteurized dairy products
Personal Prevention Measures

- **Food**
  - Don't Eat
    - Food served at room temperature
    - Food from street vendors
    - Raw or soft-cooked (runny) eggs
    - Raw or undercooked (rare) meat or fish
    - Unwashed or unpeeled raw fruits and vegetables
    - Condiments (such as salsa) made with fresh ingredients
    - Salads
    - Flavored ice or popsicles
    - Unpasteurized dairy products
    - "Bushmeat" (monkeys, bats, or other wild game)
Personal Prevention Measures

• Beverages
  – Drink
    • Water, sodas, or sports drinks that are bottled and sealed (carbonated is safer)
    • Water that has been disinfected (boiled, filtered, treated)
    • Ice made with bottled or disinfected water
    • Hot coffee or tea
    • Pasteurized milk
Personal Prevention Measures

• Beverages
  – Don't Drink
    • Tap or well water

• Fountain drinks

• Ice made with tap or well water

• Drinks made with tap or well water (such as reconstituted juice)

• Unpasteurized milk
Personal Prevention Measures

• Bathing and Swimming
  – Unclean water can also make you sick if you swallow or inhale it while bathing, showering, or swimming. Try not to get any water in your nose or mouth.
  – In some areas, tap water may not even be safe for brushing your teeth, and you should use bottled water.
  – People who are elderly or have weakened immune systems might want to stay away from areas where there is a lot of steam and water vapor that can be inhaled, such as showers and hot tubs.
Treatment: Volume Replacement

- Cornerstone of diarrhea treatment
- Military settings, insensible fluid losses increased with high ambient temperature, intense physical activity
- Oral rehydration
  - Physiological principle: Integrity of coupled transport of Na⁺ (plus H₂O and other electrolytes) with glucose or amino acids
  - Effective in majority of patients
- Intravenous rehydration
  - Severe dehydration
  - Altered sensorium
  - Intractable vomiting
Treatment: Symptomatic

• Loperamide (imodium): antimotility agent of choice
  – Slows down peristalsis, intestinal transit
  – Increased fluid and salt absorption
  – 4 mg po, 2 mg prn liquid stool (up to 16 mg per day)
  – Okay to use for non-bloody, non-febrile diarrhea.

• Bismuth subsalicylate (Pepto Bismol)
  – Reduces number of stools
  – Does not limit duration of disease
  – 525 mg (2 tabs) every 30 min for 8 doses
  – Contraindicated in persons on salicylates, warfarin
  – Can interfere with doxycycline absorption
  – Stools will be black
Treatment: Antibiotics

- Indicated for moderate to severe diarrhea/dysentery
- Combination of antibiotic PLUS loperamide leads to rapid resolution of illness
- Re-evaluate patient if no improvement after 1 wk

</tr>
</thead>
<tbody>
<tr>
<td>Initiate rehydration (oral whenever possible)</td>
<td>A-I</td>
</tr>
<tr>
<td>Perform a thorough clinical and epidemiological evaluation for any significant diarrheal illness (profuse dehydrating, bloody or febrile diarrhea, or illness in infants, elderly, or immunocompromised patients). That is, ascertain how the illness began; stool characteristics (frequency and quantity); symptoms or signs of hypovolemia; travel history; whether the patient attends a day care center; whether the patient has ingested raw or undercooked meat, raw seafood, or raw milk; whether the patient’s contacts are ill; the patient’s sexual contacts, medications, and other medical conditions, if any.</td>
<td>A-II</td>
</tr>
<tr>
<td>Perform selective fecal studies (as shown in figure 1)</td>
<td>B-II</td>
</tr>
<tr>
<td>Institute selective therapy for</td>
<td></td>
</tr>
<tr>
<td>Traveler’s diarrhea</td>
<td>A-I</td>
</tr>
<tr>
<td>Shigellosis</td>
<td>A-I</td>
</tr>
<tr>
<td><em>Campylobacter</em> infection</td>
<td>B-II</td>
</tr>
<tr>
<td>Avoid administering antimitotility agents with bloody diarrhea or proven infection with Shiga toxin–producing <em>Escherichia coli</em></td>
<td>E-I</td>
</tr>
<tr>
<td>Selectively administer available vaccines and, for travelers to (or residents of) areas where typhoid is endemic, administer typhoid vaccine (parenteral Vi or oral Ty21A)</td>
<td>B-II</td>
</tr>
</tbody>
</table>

* Letters indicate the strength of the recommendation and Roman numerals indicate the quality of evidence supporting it, respectively (see Table 1).

* Oral live (103 HgR) and killed (WCBS) cholera vaccines are available outside the United States for travelers to areas where cholera is endemic, although diarrhea is uncommon in careful travelers (B-II).
